Re7 social automation

Analyst, Investor Relations & Marketing task · Ayman Zahran · run 20261105_134559

One command pulls Re7's recent posts from X, LinkedIn and Telegram into a single table, has Claude label every post by theme and format, ranks what performs best on each channel, and then has Claude write new posts from Re7's own research using those results.

COLLECT	ANALYSE	CREATE	OUTPUT
Telegram scraped live X and LinkedIn from CSV Re7 Research RSS and website	Claude labels themes Python ranks per channel Claude writes findings	Claude drafts 9 posts from real Re7 sources Code checks every one	CSV, SQLite, report Every API call logged

How to run

```
pip install -r requirements.txt
echo 'ANTHROPIC_API_KEY=...' > .env
python run.py
```

Each run writes a new folder under runs/. This run used claude-sonnet-5-5 and made 5 API calls; the full request and response for each one is saved in ai/, so nothing in the findings or drafts was written by hand. If a source can't be fetched, a CSV is missing or the model's output fails a check twice, the run stops. There is no sample data and no fallback copy.

Design choices

Each channel is ranked on its own metric: views on X and Telegram, reactions on LinkedIn. Numbers are never compared across channels or between Capital and Labs, because the audiences are different sizes. Posts are scored by percentile within their own entity and channel, so a Labs X post is only compared with other Labs X posts. Pinned posts, thread continuations, self-reposts and anything under 48 hours old are kept in the data but left out of rankings. A theme and format combination needs at least 3 posts before it counts as a pattern.

What was collected

Entity	Channel	Posts	With metric	Method
Capital	LinkedIn	45	45	import (screenshot capture)
Capital	Telegram	0	0	no public channel found
Capital	X	31	30	import (screenshot capture)
Labs	LinkedIn	7	7	import (screenshot capture)
Labs	Telegram	20	20	scraped t.me/s/re7labsalpha
Labs	X	11	11	import (screenshot capture)

Telegram is scraped live from the public channel preview. I don't have API access to Re7's X or LinkedIn, and scraping LinkedIn breaks its terms, so those posts come in as CSV. For this run I built the CSVs from screenshots of each feed. In production the same import takes an X API pull or a LinkedIn page analytics export with no code changes. LinkedIn screenshots only show relative dates such as '3w', so those stay as shown rather than being turned into fake timestamps. I couldn't find a public Re7 Capital Telegram channel, so that row is empty.

Baseline per channel (ranked posts only)

Entity	Channel	Metric	n	Median	Range
Capital	LinkedIn	reactions	45	7	1 to 34
Capital	X	views	23	374	240 to 3,300
Labs	LinkedIn	reactions	6	8	1 to 35
Labs	Telegram	views	19	238	120 to 354
Labs	X	views	6	1,300	630 to 9,000

Best theme and format combinations

Entity	Channel	Theme	Format	n	Median	Median pct
Capital	LinkedIn	Media & events	image	3	28 reactions	93.2
Capital	LinkedIn	Media & events	video	4	11 reactions	68.2
Capital	LinkedIn	Media & events	link post	10	8.5 reactions	63
Capital	LinkedIn	Company news	link post	3	8 reactions	59.1
Capital	LinkedIn	Weekly promotion	image	7	3 reactions	28.4
Capital	LinkedIn	Research insight	chart/data visual	6	3 reactions	28.4
Capital	LinkedIn	Weekly promotion	link post	7	2 reactions	12.5
Capital	X	Media & events	image	6	410 views	56.8
Capital	X	Research insight	chart/data visual	3	374 views	50
Capital	X	Weekly promotion	image	6	310 views	20.4
Labs	Telegram	Product & vault update	image	5	253 views	66.7
Labs	Telegram	Weekly promotion	image	10	201 views	25
Labs	X	Product & vault update	image	5	1,100 views	40

Only groups with at least 3 posts are shown. The full table, including smaller groups, is in performance.csv.

What the data says

1. Media and events images lead Capital's LinkedIn results

Media & events image posts (3 posts) had a median of 28 reactions, at percentile 93. Video in the same theme (4 posts) sat at percentile 68, and link posts (10 posts) at percentile 63.

Action: Next week, publish Capital's media and event announcements on LinkedIn as image posts rather than link posts.

2. The Weekly promotion sits low on every channel

Weekly promotion images land at percentile 28 on Capital LinkedIn (7 posts), percentile 25 on Labs Telegram (10 posts) and percentile 20 on Capital X (6 posts). Capital LinkedIn link posts for the Weekly are lower again, at percentile 12 (7 posts).

Action: Stop posting the Weekly as a plain title and bullet list. Test one post that leads with a single finding from the issue, and check it against these percentiles.

3. On Telegram, Labs product updates beat the Weekly

Product & vault update images (5 posts) reached a median of 253 views, at percentile 67. Weekly promotion images (10 posts) reached 201 views, at percentile 25.

Action: Give product and vault updates priority in Telegram slots, and cut the Weekly to fewer posts there.

4. Labs X has one solid group and one early signal

Product & vault update images (5 posts) have a median of 1100 views, at percentile 40, so they are middling for Labs on X. The Binance incident text post reached 2700 views, but it is a single post and only an example.

Action: Trial a short, plain-text risk update the next time there is a market event, and track it before treating it as a pattern.

Drafts written from those findings

Capital · X · applies finding 2

Since crypto sentiment peaked on 21 September, total market capitalisation has declined just 7%, while Fear & Greed has fallen 38% on an indexed basis. Sentiment is pricing a larger correction than prices have delivered.

For Yuval Rooz, Co-Founder and CEO of Digital Asset, the company behind Canton Network, RWAs have always been the most compelling use case on-chain, and corporate treasury is where that becomes real.

Speaking with Re7 Founder and CIO Evgeny Gokhberg on Crypto Minutes, Bloomberg TV, he said: “They’ll start doing treasury management using on-chain finance.”

The conversation looks at the next phase of finance moving on-chain, and what it means for institutions that manage cash and liquidity every day.

Vault recap for anyone who missed it: Re7 Labs launched a Frax USDai Ecosystem Vault on Mainnet with Frax Finance and USD.AI.

The vault deploys frxUSD across curated opportunities in the USDai ecosystem, a collaboration between Re7 Labs, Frax Finance and USD.AI. It runs on Mainnet.

Full detail is available via the link below.

All nine drafts are in report.md and drafts.json.

Limits

• X and LinkedIn numbers come from screenshots of each feed, not an analytics export. The LinkedIn feed was sorted by Top, so it leans towards posts that already did well.

• Views on X and Telegram measure reach. Reactions on LinkedIn measure engagement. Neither tells you about clicks, follows or allocator conversations.

• Small samples. The rankings show what has worked in this window, not what causes performance. Post age and subject still affect the numbers.

• The checks catch length, banned words, unsupported numbers and missing links. They can't judge whether a claim is still current, so every draft needs a human and compliance read before it goes out.

Next steps

• Swap the screenshot CSVs for the X API and a LinkedIn page analytics export. The importer already takes both.

• Run it weekly on a schedule and track whether the recommended formats actually move the medians.

• Add click data from Substack and the website, and send drafts to a review queue in Slack or Notion.
